DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on 09/13/2007 has been entered.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 15 recites the limitation "the best state". There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim 15 is rejected under 35 U.S.C. 102(b) as being anticipated by Choi (US 5,878,092).

Choi discloses a decoding apparatus (see Fig. 1) for a Viterbi decoder (see column 1, last paragraph) with a constraint length of K (see column 2, line 1), comprising: a register-exchange network (see Fig. 1, block 13 and column 2, lines 28-67) for receiving decision bits of states (DB_i) and generating decision vectors (See column 2, lines 40-47) of survivor paths leading to the states at instant i according to the decision bits of the states from instant $i-L$ to instant i (see columns 1 and 2), wherein the states are divided into the pairs of odd and even states (see Fig. 1), the decision vectors of the states are output every L iterations (see column 2, lines 40-43), and each of the decision vectors has a length of L bits (see column 2, lines 40-43); and a trace-back unit for storing the decision vectors of the states (see column 2, lines 44-47) and finding a global survivor path sequence (see the abstract) by following the decision vectors back from the best state at instant $i-L$ (see column 2), such that L decoded bits are output every L iterations (see columns 1-2).

Allowable Subject Matter

4. Claim 1-14 allowed. The following is an examiner's statement of reasons for allowance: The combined limitations of a best survivor unit where local winner states are chosen from 2^{K-2} pairs of odd and even states, respectively and a survivor memory comprising: a register-exchange network for receiving decision bits of 2^{K-1} states and generating decision vectors of survivor paths leading to said 2^{K-2} states at instant i according to said decision bits of said 2^{K-1} states from instant $i-L$ to instant i , wherein said 2^{K-1} states are divided into said 2^{K-2} pairs of odd and even states, said decision vectors of said 2^{K-1} states are output every L iterations, and each of said decision

vectors has a length of L bits and a trace-back unit for storing said decision vectors of said 2^{K-1} states and finding a global survivor path sequence by following said decision vectors back from the best state at instant $i-L$, such that L decoded bits are output every L iterations cannot be found in the prior art of record.
